### Mass versus Voltage

Calibration curve showing the relationship between applied mass and output voltage. The best-fit line represents the linear response of the strain gauge.

Percent Error:

\* Percent Error:

$$\text{Error} = \left| \frac{V_{\text{measured}} - V_{\text{predicted}}}{V_{\text{measured}}} \right|$$
$$= \left| \frac{178.23 - 182.91}{178.23} \right|$$
$$= \left| \frac{-4.68}{178.23} \right| \times 100 = 2.62\%$$

Analysis:

\* Analysis:

$$V_{out} = V_{in} \left( \frac{R_1}{R_1 + R_2} \right) \rightarrow \text{general formula}$$

$$\therefore V_{out} = V_{in} \cdot \left[ \left( \frac{R_3}{R_3 + R_1} \right) - \left( \frac{R_4}{R_4 + R_2} \right) \right]$$

$$R_3 = \Delta R_{\text{gauge}} + R$$

$$V_{out} = V_{in} \left[ \left( \frac{(R + \Delta R_{\text{gauge}})}{2R + \Delta R_{\text{gauge}}} \right) - \left( \frac{R}{2R} \right) \right]$$

$$V_{out} = V_{in} \left[ \frac{\Delta R_{\text{gauge}}}{2R} \right]$$

amplifies  $\times 2$  (as shown by Oscope).

$$\therefore V_{out} = V_{in} \left( \frac{\Delta R_{\text{gauge}}}{R} \right)$$

$$\therefore \Delta R_{\text{gauge}} = 1.92$$

Mass:

\* Mass to get a change of 20mV on output voltage:

$$\begin{aligned} & \text{reciprocal of slope (from line of best fit)} \\ & = 1/2.1539 = 0.4643 \end{aligned}$$

$$20(0.4643) = 9.29 \text{ grams}$$
